START HERE

Dispatcher dashboard and driver app

A practical guide for creating orders, managing a shift and following each trip.

Use this guide during the pilot. The diagrams explain the operating rules. They are not screenshots of the app.

Dispatcher
Creates the order and chooses its audience.

→

Driver
Confirms the offer and carries out the trip.

→

Shared state
Keeps assignments, balances and messages in sync.

Find the right instructions

Create and send an order

Use the map and manage drivers

Start a driver shift

Accept and complete a trip

Chat, reconnect and recover

Read daily figures and prepare a pilot

Cancel or complete a trip

Profile, history and notifications

One account, one working phone

Account safety

> All prices are in TMT. The current pilot uses synthetic balances. Do not treat a displayed balance as a real payment.

Create an order

1. Sign in on the dispatcher page with your assigned phone number and password. The +993 prefix stays fixed. Enter the eight local digits.
2. Open **Заказы** and choose **Создать заказ**.
3. Choose the region, enter the customer phone number and a positive price in TMT. These fields are required.
4. Add an optional pickup, destination or note. On wide screens, use the large map beside the form. On smaller screens it sits below. Choose Откуда or Куда before placing a point; Убрать clears it.
5. Choose a public announcement or a private driver, then send the order. For a private offer, a selected driver is required.

Public announcement

Available immediately
Eligible drivers in every region can claim.

→

Regional popup
Only the order’s region receives a 20-second popup.

→

First claim wins
The order disappears for everyone else.

Private offer

Select a driver
Online, free, fresh GPS, enough balance.

→

20-second offer
The selected driver must confirm.

→

Expiry choice
Open to all regions, or stop unassigned.

> Choose whether to offer the order to other drivers after the private deadline. When ON, all regions open at once without a second popup or timer. When OFF, the order remains unassigned for the dispatcher to handle.

An early private decline frees the driver. The order stays hidden until its original deadline; the expiry choice then applies. The customer phone is hidden until acceptance.

DISPATCHER · MONITORING

Find a driver and follow the trip

1. Open the monitoring map. Search the roster by name, phone or vehicle plate. Filter by region or status. On mobile, open the driver list as a bottom sheet.
2. Select a driver from a map marker or roster row. Check the location age, online state and whether the driver is free.
3. Use **Предложить заказ** for an eligible driver. Choose an existing waiting order or create a new private order.
4. Follow the assigned order through pickup, waiting and the trip. A last known point is not a live position.

What you see	What it means
Free	Online with fresh location and no active trip. Assignment still checks eligibility on the server.
In trip	The driver has an accepted, waiting or started trip and cannot receive a second assignment.
Check GPS	Coordinates are missing or stale. Ask the driver to check location and connectivity.
Offline	The driver is not available for new work. The map may still show a timestamped last location.

Drivers and balances

Create drivers in the driver list. Use a valid +993 phone number. A six-digit numeric password is allowed. When changing a phone or resetting a password, give the new credentials to the driver privately. Previous access is revoked and the driver signs in again.

Top up the pilot balance before assigning work. A driver needs the full order price to accept. For example, 15 TMT cannot cover a 30 TMT order. The app prevents a negative balance. If an adjustment response is uncertain, retry the same unchanged action. Refresh an old dashboard tab when asked; do not start a new adjustment until you check the balance history.

Get ready and go online

1. Open the driver app and sign in with your assigned phone number and password.
2. After the first driver login, allow precise location, then optional notifications. Enable Android system location. Denied or dismissed prompts do not repeat on login: use GPS or Profile to recover manually. Notifications never block a shift.
3. Controls run left to right: GPS, dispatcher connection, shift. Tap the connection icon for details. Green means confirmed connection, amber means shift recovery, red means disconnected outside recovery.
4. Press the Online switch. The app confirms the shift with the dispatcher before showing that you are live.
5. Swiping the app away keeps the shift running. When finished, press Offline. Android Force stop blocks delivery until reopening.

Location ready
Permission, system GPS and a fresh position.

→

Connection ready
The app can reach the dispatcher.

→

Online confirmed
The dispatcher can offer new work.

Region cards: available public orders : on-shift drivers, including busy drivers. A claim decreases the left count for everyone. Read the colour rules on page 12.

Situation	What to do
Location disabled	Enable location permission and Android system location, then return to the app.
No internet	Restore Wi-Fi or mobile data. GPS alone cannot send updates or accept work.
Outside every region	Your real location stays visible as outside region. You may claim public orders immediately, subject to the normal eligibility checks.
Address missing	Use the region and coordinates. An address lookup failure never blocks a shift.

> GPS can stay green without internet. Connection retries automatically. If the shift cannot recover within 60 seconds, its power button turns off. Restore connection and tap the same power button again. Accepted trips remain assigned.

On the target Android phone, background delivery must still be checked with the screen locked and battery restrictions enabled. A closed browser does not provide reliable background alerts.

From acceptance to completion

Accept
Choose arrival time and confirm. Price is charged once.

→

At pickup
Press Я на месте and wait for the customer.

→

Customer boarded
Press Начать поездку.

→

Trip finished
Press Завершить поездку.

1. The home grid shows every saved region. Each card shows unfinished orders first, then online drivers. Claimed trips stay in the order count. Open a region for orders still available to claim.
2. A new regional or private offer can appear automatically. A private offer has a fixed 20-second deadline. Decline it if you cannot take it.
3. Check the price and arrival time. Accept only when you can carry out the trip. A customer phone appears after acceptance; use it to confirm pickup.
4. Use the price, call and next-trip controls above the region grid. Open the trip details for extra information or permitted cancellation.
5. Complete the trip once it is finished. Completion does not charge the price again.

> If another driver claims first, the order disappears. If you try at the same moment, the app reports that it is already taken. Only one driver can own the order.

Balance and cancellation

You need enough balance for the full price. With 30 TMT, you can accept a 30 TMT order. With 15 TMT, a 30 TMT order can be visible but cannot be accepted.

You can cancel only while waiting for the customer, after Я на месте. You cannot cancel immediately after acceptance or once the trip starts. A permitted cancellation refunds the original charge once. Do not repeatedly accept and cancel to test a live customer order.

> If you lose internet, keep the accepted trip in mind and reconnect. Do not create another account or accept a second trip. If the trip cannot be completed in the app, contact the dispatcher.

Chat and recovery

1. Open the conversation with the dispatcher or selected driver. Type a message and press Send. Enter sends; Shift+Enter adds a line.
2. Read older messages inside the chat area. The app keeps your reading position when you scroll upward.
3. If a send fails, the draft stays available. Retry it. The same retry does not create a duplicate message.
4. After returning, let the app recover missed messages and the current order. If session verification fails, restore internet and press Повторить подключение; sign-in details stay saved.

Connection lost
The last displayed information may be old.

→

Reconnect
The app checks current server state.

→

Work continues
The accepted trip and balance remain consistent.

Question	Answer
The order vanished before I accepted	Another driver may have accepted it, or the dispatcher may have cancelled or changed the offer.
GPS works but I am not online	Location and shift availability are separate. Check internet, balance and the Online confirmation.
The address is missing or old	Use region and coordinates. One convenience lookup may run before the shift; on shift, the visible home-screen location view refreshes every five minutes. A stale label is hidden.
I closed the app	Swiping away preserves the shift. Force stop blocks delivery until reopening. Explicit Offline or logout ends availability. Accepted trips stay assigned.
I forgot to complete a trip	Complete it after reconnecting. If the controls fail, ask the dispatcher to resolve it with a recorded reason.

> Chat previews can appear on the lock screen, subject to Android privacy settings. Visible chat stays quiet; other screens receive alerts. Use chat while safely stopped.

Read the pilot results

The Today panel follows Asia/Ashgabat time. It groups orders by the date they were created. Live waiting orders are counted separately, including orders left from yesterday.

Measure	How to read it
Waiting orders and oldest wait	The work still available now. Active private reservations are separate. Stopped private orders are not public waiting work.
Median / p90 acceptance time	Typical waiting time and the time within which 90% of measured orders were accepted. Check the sample count.
Completed / cancelled	Outcomes for orders created today. Unfinished orders are shown separately. Rates use completed plus cancelled orders.

Before the phone pilot

1. Use the freshly built APK and the matching deployed service. An older installed APK may show older screens.
2. Test one public order, one private acceptance, one expiry and two drivers claiming the same order. Confirm only one wins.
3. Check the price charge, permitted cancellation refund and normal trip completion.
4. Test GPS permission changes, screen lock, background delivery, Wi-Fi/mobile switching and a connection loss.
5. Keep the phone model, Android version and observed result with the test record.

> This is a pilot guide. Production signing, update distribution and physical Infinix Android 14 background reliability still need release verification.

Release notes for this edition

Public orders now open to all regions immediately, with a regional popup only. Private offers keep their fixed deadline and expiry choice. GPS readiness, trip resolution, balance safeguards and chat recovery remain in place. The compact driver feed, busy-driver monitoring guards and Today analytics are merged. Balance safeguards, safe adjustment retries and the restriction on cancelling started trips are merged. Session and device protections are merged and covered by the release checks.

Cancel or complete?

Cancellation means no drive took place. Completion means the drive was provided.

Accepted
The driver is on the way. The quoted price was charged.

→

Waiting
The driver arrived and is waiting for the customer.

→

Started
The customer boarded. Ordinary cancellation ends.

→

Completed
The drive was provided. No extra debit or refund.

Stage	Driver	Dispatcher
Unassigned	Accept an eligible offer	Cancel before acceptance. There is no charge to refund.
Accepted	Call the customer and go to pickup. No cancellation.	Cancel if the drive will not happen. Refund the recorded charge once.
Waiting	Start after boarding, or cancel if the drive will not happen.	Cancel before the trip starts. Refund the recorded charge once.
Started	Complete when the drive finishes. Cancellation is blocked.	If the completed drive is stuck, complete manually with a required reason. No refund or second debit.
Completed or cancelled	Review the result	Review the history. Do not repeat a terminal action.

When a trip needs completion

1. A started trip older than 15 minutes receives a warning. This is a reminder, not automatic completion.
2. Call the driver. Confirm whether the customer is still in the car or the drive is finished.
3. If the drive is finished and the driver cannot close it, choose Завершить вручную. Enter the actual reason.
4. Confirm the completed status. The record keeps the same driver, original charge, dispatcher identity and reason.

> Started trips cannot be cancelled. Exceptional refunds require a separate reviewed recovery process.

Profile, history and notifications

Review a previous order

1. Open Profile and expand an order in history. Check its TMT price, status, region and date.
2. When available, review pickup, destination, customer phone and call action, dispatcher notes and cancellation reason.
3. Use the lifecycle times and order identifier to discuss the same record with the dispatcher. Missing route details stay unspecified; history does not repeat a charge.

Chat alerts, even off shift

Every signed-in Android installation of an approved account can receive chat alerts with GPS and shift off. Messages arrive through the live connection or FCM fallback. Reading synchronizes across devices and clears the corresponding alerts.

Profile has one notification switch for orders and chat. Enable it and Android notification permission to receive system alerts. Muting either never blocks a shift. Logout, blocking and credential changes revoke the old installation access.

Dispatchers see a banner, sender and message preview with a short sound in each dashboard tab outside the active conversation. Browser sound may require a prior click.

> This page describes the candidate, not a guarantee about an older APK. Test locked-screen and background delivery on the Infinix Android 14. Force stop, unavailable networks and battery restrictions can block or delay delivery.

Driver addresses: one convenience lookup before the shift, one fresh lookup after Online, then five-minute updates in the visible home-screen location view. Background requests pause. Dispatcher requests stay disabled. See page 12.

One account, one working phone

The dispatcher approves the driver account. An approved driver can sign in on any phone; there is no separate device approval or device-management screen.

Sign in on another phone
Both phones can stay signed in, view the account and use chat.

↓

One phone owns the shift
A second phone cannot go Online or control the working phone's location or trip progress.

↓

Switch the working phone
End the first shift with Offline or logout. If its connection is lost, wait for its 60-second availability to expire before starting on the second phone.

Off shift, each phone shows its own coordinates and may fetch one convenience label without updating shared tracking. Online submits a fresh point and starts the shift together. Offline stops tracking, even during a trip; the dispatcher retains the last reported point and time.

If a phone is lost or access must stop

1. The dispatcher chooses Sign out everywhere for that driver. This ends the shift and revokes all sessions.
2. The assigned trip, password and balance remain. The driver signs in again to continue the assigned trip.
3. For a lost phone, reset the password too. Sign out everywhere alone does not prevent a new login by someone who knows the password.

> Signing in on another phone never transfers a shift automatically. The server rejects competing starts; refresh the state after a blocked attempt.

Protect access without changing a trip

Choose the account action for the situation. These controls do not cancel an order or move money.

Action	Result
Sign out everywhere	Ends every session and the shift. Keeps approval, password, balance and assigned trip. The driver can sign in again.
Block temporarily	Enter a required reason. Access and the shift stop immediately, even during a trip. The trip stays assigned: contact the driver and resolve it separately. Unblock permits a new login.
Delete account	Permanent access removal; no Reactivate action. Resolve unfinished trips first. Old messages, balance records, trips and statistical attribution remain.

1. For a lost phone, sign out everywhere and reset the password. A person who still knows the password could otherwise sign in again.
2. Do not cancel a trip merely to clear a blocked account. Use the permitted order action only after checking what happened.
3. A released phone number can submit a new application. It needs fresh approval and starts with zero balance and separate history.

> Deleting an account is not a database reset. Old completed/cancelled orders and financial records remain in normal operation. Clearing an isolated test environment is separate maintenance.

Read the grid, then refresh an address

Each card reads **available public orders : drivers on shift**. The two numbers answer different questions.

Before shift
One convenience lookup from fresh local GPS; no tracking update.

→

Online succeeds
One fresh lookup, then five-minute updates in the visible home-screen location view.

→

Hide and return
Pause in background; one catch-up only if due.

Signal	Meaning
Left number	Unassigned public orders available to claim. Accepted, waiting and started trips are excluded.
Right number	Drivers on shift in that region, both free and busy.
Green card	There is at least one available public order. This does not identify your location.
Blue border	This phone has fresh usable local GPS, internet and a point inside that saved region. It can show before a shift. No blue border without internet, usable GPS or a matching region.

Live counts and claiming require a shift. GPS can remain green without internet while the blue region border disappears. Region matching uses saved boundaries, not an address lookup.

Address names are optional

1. Before a shift, fresh precise GPS, internet and the visible home-screen location view may fetch one convenience address. It uses a transient point and never changes shared tracking or the dispatcher map.
2. After explicit Online succeeds, fetch a fresh address again. This may bypass the convenience cooldown once. Repeated Online taps cannot repeat the exception.
3. While on shift with the home-screen location visible, refresh every five minutes, even without movement. In the background, pause. Return or reconnect makes one catch-up request only if due.
4. Manual refresh shares the five-minute limit across phones and restarts. The convenience attempt is remembered across reloads, relaunches and logins. Dispatchers never request or display address labels.

> Every request obeys the shared daily budget, 20% reserve and provider backoff. Failed or stale labels fall back to region and coordinates. Lookup never blocks GPS, Online, claims or trip actions.

Quota reset is documented as midnight Moscow time. Enable only the isolated APK environment after configuration readback; shared development stays disabled to avoid competing budgets.
